

# ME2720 Macroeconomics for Business

## Lecture 5

Luis Perez

KTH Royal Institute of Technology

November 13, 2017

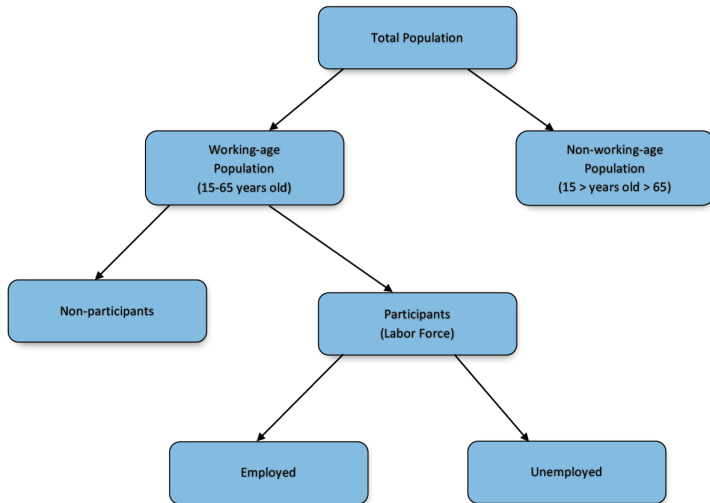

# Outline

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

# A Quick Look at the Labor Market

- Labor force as a key determinant of output

# Some Useful Ratios

- **Participation rate**

$$\text{Participation rate} = \frac{\text{Labor force}}{\text{Working-age population}}$$

- **Unemployment rate**

$$\text{Unemployment rate} = \frac{\text{Unemployed}}{\text{Labor force}}$$

- **Employment rate**

$$\text{Employment rate} = \frac{\text{Employed}}{\text{Labor force}}$$

- Most-reliable measures obtained from survey data
- Equivalence of definitions and methods is key for cross-country comparisons

# The Importance of the Two Ratios

$$\begin{aligned} \text{GDP pc} &= \frac{\text{GDP}}{\text{Population}} \\ &= \underbrace{\frac{\text{GDP}}{\text{Hours}}}_{\text{Labor Productivity}} \times \underbrace{\frac{\text{Hours}}{\# \text{ Employed}}}_{\text{Avg. Hours Worked}} \times \underbrace{\frac{\# \text{ Employed}}{\text{Labor Force}}}_{\text{Employment Rate}} \times \underbrace{\frac{\text{Labor Force}}{\text{Population}}}_{\text{Participation Rate}} \end{aligned}$$

# The US Labor Market, October 2017

Data from the Bureau of Labor Statistics

- **Participation rate**

$$\text{Participation rate} = \frac{160,381,000}{255,766,000} = 62.7\%$$

- **Unemployment rate**

$$\text{Unemployment rate} = \frac{6,520,000}{160,381,000} = 4.07\%$$

- **Employment rate**

$$\text{Employment rate} = \frac{153,861,000}{160,381,000} = 95.93\%$$

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

# A Simplistic Labor Market Model I

- Recall:  $Y = f(A, K, L)$

## Marginal product of labor

The **marginal product of labor** (MPL) is the amount of extra output  $Y$  that one additional worker can produce keeping other factors of production ( $K, A$ ) fixed.

- Most models assume decreasing MPL
- Key role of MPL in firms' decision to hire employees
- You can think of the MPL curve as the “labor demand” (LD) curve
- Extra revenue ( $ER$ ) by hiring 1 additional worker

$$ER = P \times MPL$$

## A Simplistic Labor Market Model II

- Extra cost of hiring 1 additional worker:  $EC = W$
- Profitable to hire that (additional) worker?

$$P \times MPL > W \quad \Leftrightarrow \quad MPL > \frac{W}{P}$$

- Real wage,  $W/P$ : relative to the price of output
- Firms' profit-maximizing behavior

$$MPL = \frac{W}{P}$$

- Assuming a Cobb-Douglas production function

$$\frac{W}{P} = (1 - \alpha)A \left( \frac{K}{L} \right)^\alpha, \quad \alpha \in (0, 1)$$

# A Simplistic Labor Market Model III

- Increases in either  $A$  or  $K$  shifts the  $MPL$  (LD) curve outwards

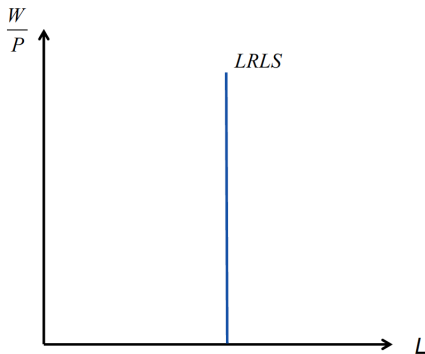

# A Simplistic Labor Market Model IV

- Two effects of a higher real wage on SRLS
  - 1 Substitution effect  $\Rightarrow$  work more
  - 2 Income effect  $\Rightarrow$  work less
- What happens to SRLS depends on the relative strength of substitution- and income- effects!
- Data suggest that substitution effect dominates in the short-run

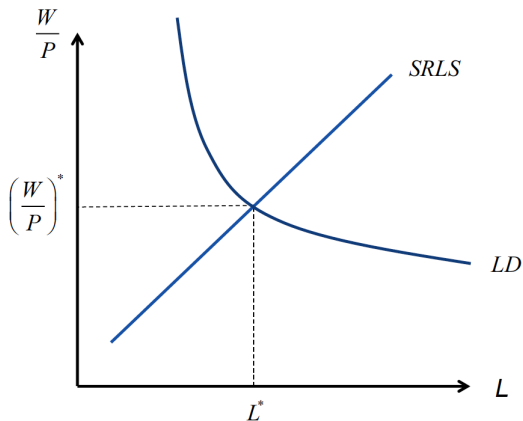

# A Simplistic Labor Market Model V

- In the long-run the data shows:
  - ★ No trend in unemployment
  - ★ Higher real wages
  - ★ Vertical LRLS

# A Simplistic Labor Market Model VI

- Two equilibria:
  - ① Short-run equilibrium

# A Simplistic Labor Market Model VII

## 2 Long-run equilibrium

# A Simplistic Labor Market Model VIII

- So, 2 types of unemployment:
  - ① Short-run unemployment varies with the BC
  - ② Long-run unemployment, i.e. **natural rate of unemployment**
    - ★ “Average” unemployment over the BC
    - ★ Not dependent on the BC

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment**
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

# The Natural Rate of Unemployment I

- Long-run unemployment theories emphasize:
  - ★ Minimum wages
  - ★ Efficiency wages
  - ★ Contracts
  - ★ Insider-outsider models
  - ★ Search and matching models
- Variations in natural rate of unemployment reflect structural differences and different government policies
- A cool, important concept the book forgets to mention:

## NAIRU

The **non-accelerating inflation rate of unemployment** (NAIRU), also referred to as the long-run Phillips curve, is the unemployment consistent with maintaining stable inflation.

# The Natural Rate of Unemployment II

- A model in which both firms and workers have monopoly power
- The more monopoly power either party has, the higher the natural rate of unemployment will be
- Firms' price-setting behavior: price larger than  $MC$

$$P = \left(1 + \frac{x}{100}\right) W \quad \Leftrightarrow \quad \frac{W}{P} = \frac{1}{1 + x/100}, \quad x > 0$$

- Workers' wage-setting behavior through labor unions:

$$\frac{W}{P} = A - bu, \quad A, b > 0$$

- Higher unemployment ( $u$ ) implies lower wage demands as it is both more likely and more costly to become unemployed

# The Natural Rate of Unemployment III

- Equilibrium where firms' price-setting behavior equals unions' wage-setting behavior:

$$\frac{1}{1 + x/100} = A - bu^*$$

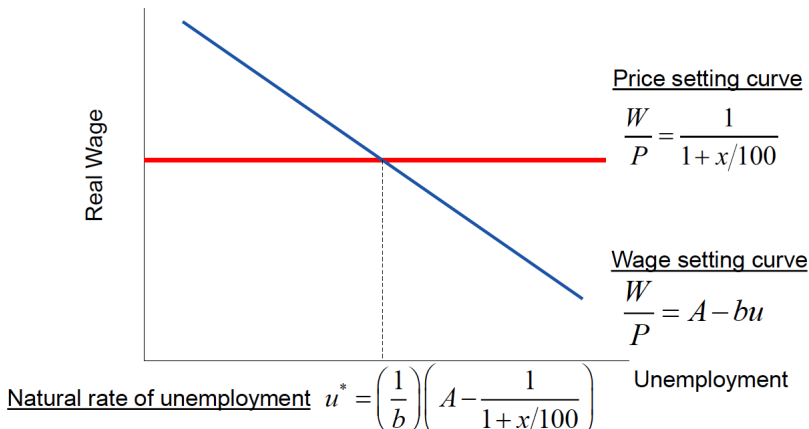

- Solving for  $u^*$ :

$$u^* = \left(\frac{1}{b}\right) \left(A - \frac{1}{1 + x/100}\right)$$

- Natural rate depends on
  - ★ Firms' market power,  $x$
  - ★ Trade unions' strength,  $A$
  - ★ Sensitivity of wage demands,  $b$

# The Natural Rate of Unemployment IV

- Graphically:

# The Natural Rate of Unemployment V

- More (*firm*) monopoly power associated with higher mark-ups ( $x$ ) and, thus, lower real wages and higher unemployment

# The Natural Rate of Unemployment VI

- More (*workers*) monopoly power associated with stronger trade unions ( $A$ ), which demand higher wages. This leads to higher unemployment.

# The Natural Rate of Unemployment VII

- The more sensitive ( $b$ ) wage demands are to unemployment, the steeper the wage-setting curve, and the lower unemployment!

$$u = \frac{A - W/P}{b}, \quad b > 0$$

# The Natural Rate of Unemployment VIII

## Conclusions

To understand the natural rate of unemployment:

- Firms' market power
- Workers' market power:
  - ★ Extent of union membership
  - ★ Unemployment benefits
  - ★ Long-term unemployment:  $> 12$  months (OECD)
  - ★ Skills mismatch
  - ★ Payroll- and income- taxes

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment**
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

# Lowering Unemployment

- Active labor market spending (specialized job sites, matching, training, loans to entrepreneurs, subsidize job creation, . . . )
- Wage bargaining: centralized vs. decentralized
- Employment protection legislation (EPL)
- Labor market reform: liberalist (US) vs. interventionist (Sweden)
  - ★ UK lowered unemployment through market-based approach
  - ★ Netherlands lower unemployment through labor market spending

# Lowering Unemployment

## Employment protection legislation (EPL)

- EPL aims to reduce unemployment by restricting firms' ability to hire workers
- Some people lose their jobs, either voluntarily or involuntarily
- Some people stop being unemployed: exit labor force or find a job
- Thus, **inflows** into and **outflows** from unemployment
- Inflows into unemployment:

$$\text{inflow} = pL$$

where  $p$  is the prob. of losing a job

- Outflows from unemployment:

$$\text{outflow} = sU$$

where  $s$  is the prob. of finding a job

# Lowering Unemployment

## Employment protection legislation (EPL)

- In equilibrium: inflows = outflows

$$pL = sU$$

- Knowing that  $LF = L + U$ , we can rearrange,

$$p(LF - U) = sU$$

- Dividing by  $LF$ ,

$$p \left( \frac{LF}{LF} - \frac{U}{LF} \right) = \frac{sU}{LF} \quad \Leftrightarrow \quad p(1 - u) = su$$

- Solving for  $u$

$$u^* = \frac{p}{p + s}$$

# Lowering Unemployment

## Employment protection legislation (EPL)

- NR of unemployment,  $u^*$ , depends positively on  $p$  the probability of losing a job, and negatively on  $s$  the probability of finding a job
- EPL seeks to lower  $p$ ...
- ...although it also affects  $s$ : firing is costly!
- Overall, *EPL* has offsetting effects on  $u^*$ : it lowers job destruction but reduces job creation
- EPL benefits the employed at the cost of the unemployed!

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data**
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

# A Quick Look at the Data I

Figure: Estimates of the natural rate of unemployment

# A Quick Look at the Data II

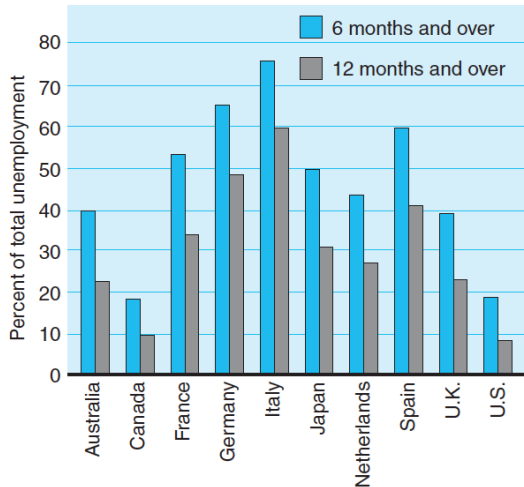

Figure: Long-term unemployment, 2002

## A Quick Look at the Data III

Figure: Population mobility, 1980-1987

# A Quick Look at the Data IV

Stricter EPL associated with lower unemployment inflows

Figure: Unemployment inflows OECD

# A Quick Look at the Data V

Stricter EPL associated with lower unemployment outflows

Figure: Unemployment outflows OECD

# A Quick Look at the Data VI

Overall, EPL doesn't seem to affect unemployment rates

Figure: EPL and unemployment OECD

# A Quick Look at the Data VII

Stricter EPL favors employed workers!

Figure: EPL and employment duration OECD

# A Quick Look at the Data VIII

Stricter EPL works against unemployed people!

Figure: EPL and unemployment duration

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments**
  - Assumptions
  - Missing values
- 7 Students' presentations

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

# Making Assumptions

- Data not always available, e.g. avg. annual hours African countries
- Make (reasonable) assumptions!
- Important part of empirical work
- It is okay that your results depend on them!
- Just try to convince the reader of why your assumption makes sense!

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

# Missing Values I

- Several options:
  - ① Look for the best proxy when no data are available for “ideal” measure
  - ② Make assumptions if there neither data nor proxies available
  - ③ Impute a value!
  - ④ Drop the entire observation
- Two imputation methods:
  - ① Interpolation, when missing intermediate data
  - ② Extrapolation, when missing top- or bottom- end data in the series
- Interpolation is *way safer* than extrapolation!
- When is imputation possible?
  - ★ Slow movements in data
  - ★ Regular variation in data

# Missing Values II

- How to impute values?
  - ★ Linear trend
  - ★ Regression estimates
  - ★ Cubic splines
  - ★ Look at the data!
- An example of imputation

Year	X
1	142
2	124
3	100
4	.
5	.
6	97
7	112

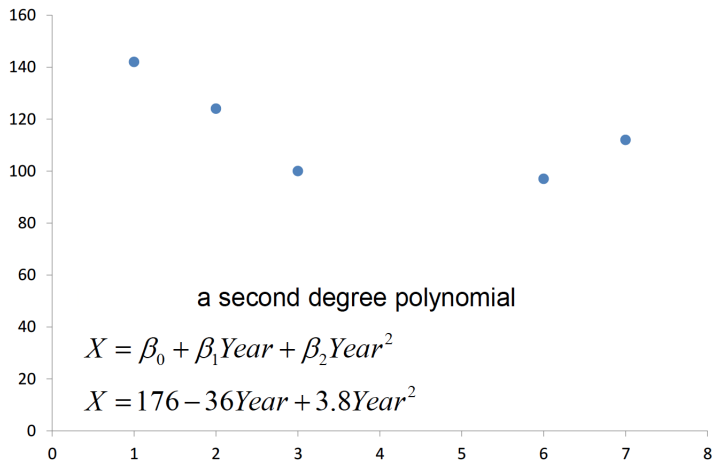

# Missing Values III

- Look at the data

# Missing Values IV

- Looks like...

# Missing Values V

- Let's see...

# Missing Values VI

- Cubic splines (Stata, Matlab, R, Python, etc.)

# Missing Values VII

- Linear trend:

Year	X
1	142
2	124
3	100
4	99
5	98
6	97
7	112

$$X_4 = \left( \frac{97 - 100}{3} \right) + 100 = 99$$

$$X_5 = \left( \frac{97 - 100}{3} \right) + 99 = 98$$

# Missing Values VIII

- Linear trend:

- 1 A Quick Look at the Labor Market
- 2 A Simplistic Labor Market Model
- 3 The Natural Rate of Unemployment
- 4 Lowering Unemployment
- 5 A Quick Look at the Data
- 6 Assignments
  - Assumptions
  - Missing values
- 7 Students' presentations

Thank you for your attention!
